# Reflexion des Projekts (1)

## Orbit Hotel

- ▶ Bietet einem Hotelunternehmen die Möglichkeit, Zimmerübernachtungen an Kunden zu verkaufen
  - ▶ Hotelmitarbeiter (Hotelier) offerieren neue Zimmer
  - ▶ Hoteliers sehen Zimmerbewertungen
- 
- ▶ Bietet Kunden die Möglichkeit nach Zimmern zu suchen
  - ▶ Können von Kunden gebucht werden
  - ▶ Kunden können Zimmer bewerten

# Reflexion des Projekts (2)

- ▶ „Analysten“ → Für die Buchhaltung und die Preisgestaltung
- ▶ Analysten sehen Bewertungen
- ▶ Unterstützen Hotelier in der optimalen Preisgestaltung
- ▶ Können 3 verschiedene Statistiken erfassen

# ServletKlasse - MasterServlet

- ▶ Von JSPs aufgerufen
- ▶ Erstellt Session
- ▶ Holt sich Parameter aus JSP
- ▶ Ruft Methoden aus Hotelmanagement mit Parametern auf
- ▶ SendRedirect

# Verwaltungsklasse Hotelmanagement

- ▶ Schnittstelle zwischen Servlet und Programm
- ▶ Beinhaltet wichtigste Verwaltungsmethoden
- ▶ Erhält von MasterServlet Methodenaufrufe mit Parametern
- ▶ Speichert und liest aus DAO-Klassen

# Rate Booking

        else
            return "HotelierInterfaceFail.jsp";
    }
}
```

# Java Script Implementierung

- ▶ Zu Beginn der JSP Seiten
- ▶ Formulareingaben werden validiert, bevor sie an das Servlet gesendet werden
- ▶ Erstellung einer Funktion (z.B. RegisterÜberprüfung() )
  - ▶ Überprüfung mittels if() Statements
  - ▶ Bei „return false“ erfolgt keine Weiterleitung → Alert-Fenster
  - ▶ Bei „return true“ Weiterleitung erfolgt
- ▶ Ziel: Entlastung des Servlets durch zu viele unsinnige Eingaben

```

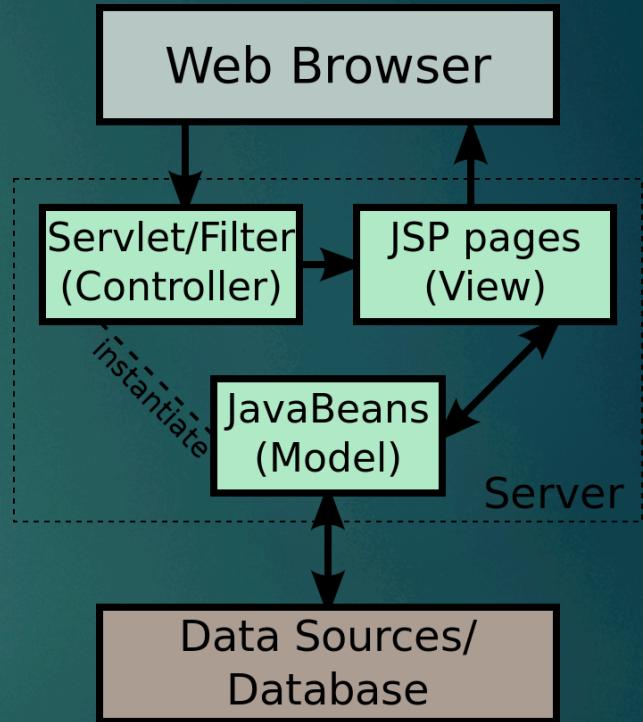

<link rel="stylesheet" href="css/submitButton.css">
<script type="text/javascript">
function checkFormValidation() {
    if ((document.NewOffer.roomnumber.value == "") || isNaN(document.NewOffer.roomnumber.value) || (document.NewOffer.roomnumber.value < 1)){
